

CASE STUDY #2

DECEMBER 1, 2024
DAMIAN TRENT WILSON
Cal State University Los Angeles

VISUAL:

The graph is about diabetes but lacks a lot of information to understand the information given. As the colors make the graph understandable the different variations of colors are too light and like make a distinction between the differences of races that have diabetes. One solution they've could have made was a dark to light color distinction to better separate the races (Shahazad, 2024). Another aspect of the information given is not clear as there are different types of diabetes like type 1, type 2 and gestational diabetes which only women can obtain. Which brings me to the next issue at hand as they have different age groups but its not showing how many of the occupants are male or female which play a lot in the data role.

As for me, I know the difference between the types of diabetes. I can high assuming this graph is referring to type 2 diabetes. As most type one diabetes are mostly children around the age of 5 that's why it referred to juvenile diabetes as this graph shows more growth in the preteen years which doing research type 2 diabetes is growing particularly in that age group. As well as in the graph it showed data about high income which I feel was unnecessary data to add to the graph. As yes diabetes can be an expensive illness to manage, but this graph was to show the growth in diabetes not the cost of the disease. Another aspect of information added but not clear is the prevalence of percentage of diabetes its not clear of how many females or males obtain this disease as well as the figure in what countries, is it by the thousands or millions or people in those specific countries how many are men or women or children. The article given as well as the graph was a graph from between the years 1990 to 2021 which still isn't clear of a lot of data just by looking at the graph I would assume this is updated data from 2024 but its not by having

the data title could tell the reader this is older data and they could find more up to date data even though a lot of data about diabetes growth has stayed the same and the growth in diabetes is getting higher as years pass (Ong,2021). Another aspect that could have been updated it showing the growth over the years of 1990-2021 instead of given percentages of a number that's not clear is it millions of people tested thousands or billions its not validly clear.

In conclusion, for the aspect of people do not know the specifics unless doing research the graph has a lot of information not presented visually to be able to understand the information given overall. A graph should be able to show enough data for anyone to comprehend with not as much information given. As words can help explain key details it lacked any keywords to better understand the graph. This graph had enough data that if it was used on a paper the audience would understand. As graphs should be able to be understood with adequate data to understand and not bombard the reader to understand the data.
